

FIRST MEASUREMENT RESULTS AT THE LEG PROJECT'S 100 keV DC GUNTEST STAND

S. C. Leemann, Å. Andersson, R. Ganter, V. Schlott, A. Streun, A. F. Wrulich PSI, Villigen, Switzerland

Introduction

The Low Emittance Gun Project (LEG) at PSI aims at developing a high-brightness, high-current electron source: a 20-fold improved brightness compared to present state-of-the-art electron guns. The source is intended to form the basis for a cost-efficient implementation of a high-power X-ray FEL light-source for scientific research at PSI.

A field emitter array (FEA) cathode is being considered a source candidate. In order to study pulsed field emission from such a cathode and to investigate space charge compensation techniques as well as to develop diagnostic procedures to characterize the beam resulting from an FEA cathode, a 100 keV DC gun test stand has been built. The test stand gun and diagnostics have been modeled with the codes MAFIA and GPT. From extensive parameter studies an optimized design has been derived and construction of the gun and diagnostics have recently been completed. We report on the commissioning of the test stand and present first measurement results.

Test Stand Setup

 FEA consists of thousands of gated molybdenum nano-tips; put on negative DC potential of I00kV

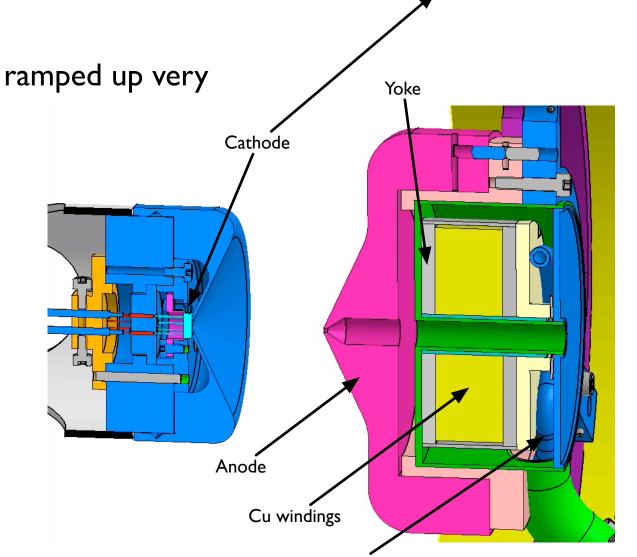

• Each FEA tip emits a beamlet when the gate layer is pulsed (>5ns, <320V)

• Bunch accelerated in 11mm gap (E < 20MV/m)

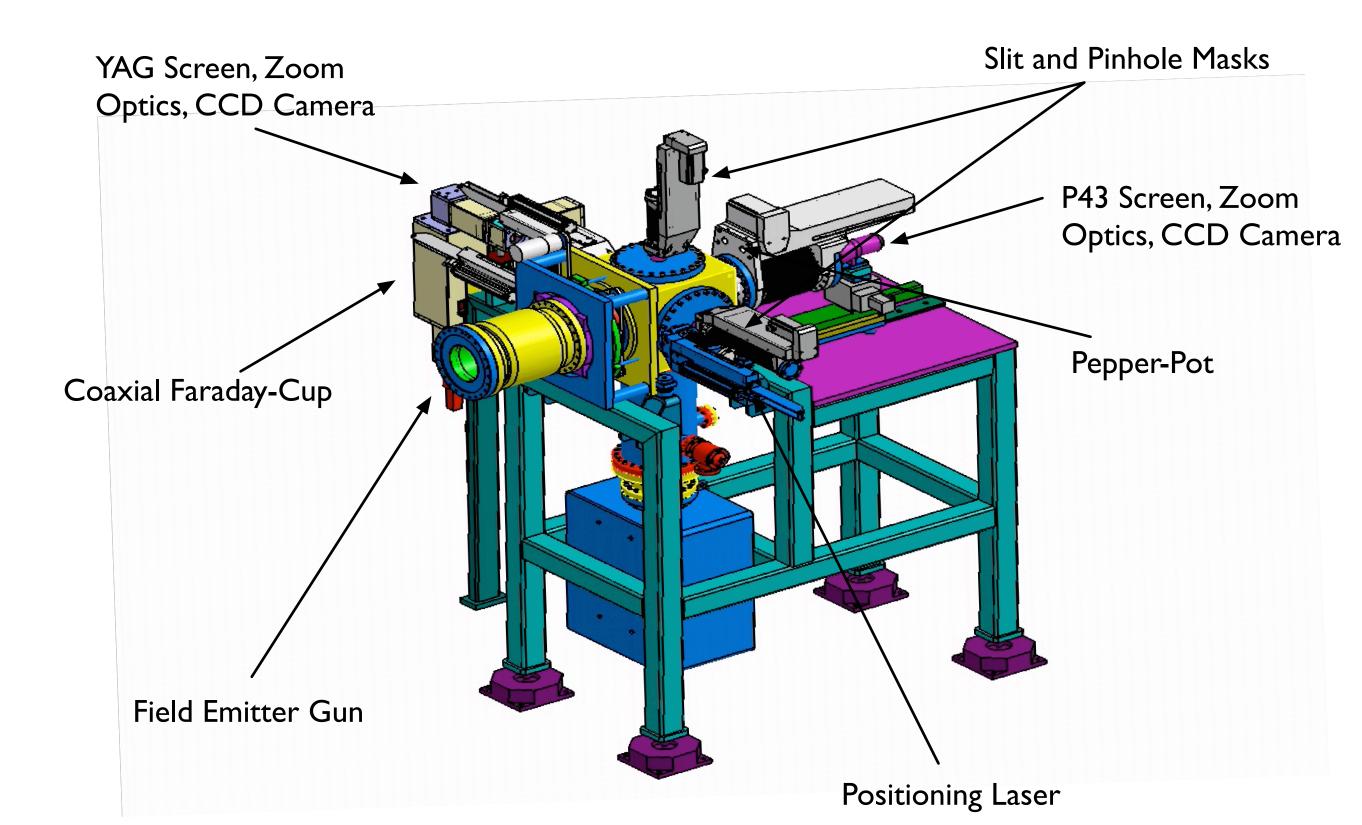

• In-vacuum DC solenoid capable of delivering 200 mT on axis; field confined by iron yoke; heat dissipated by water-coolong circuit

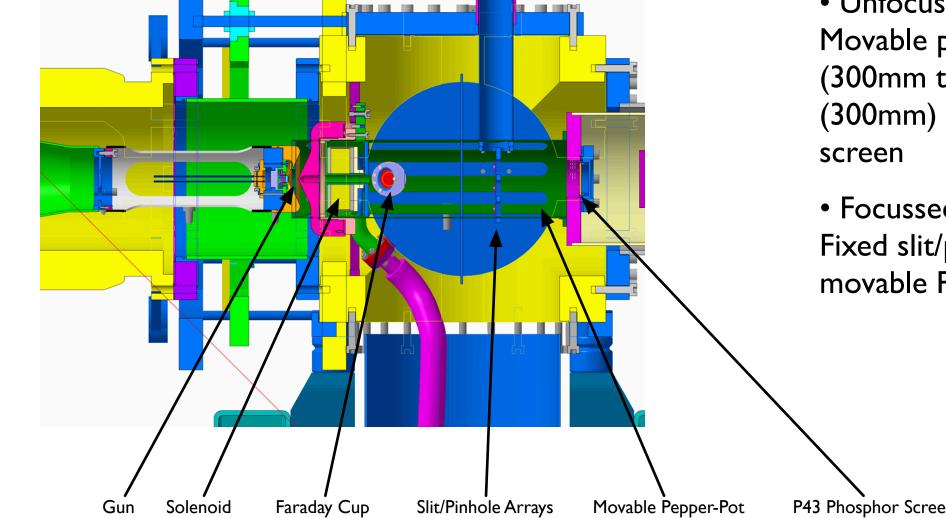

• FEA is destroyed by HV breakdown → DC HV has to be ramped up very carefully (60kV stable operation has been reached)

Diagnostics Overview

- Unfocussed Case
 Movable pepper-pot arrangement
 (300mm travel) with fixed distance
 (300mm) between pepper-pot and P43
 screen
- Focussed Case
 Fixed slit/pinhole array insert with movable P43 screen (300mm travel)

Emittance Measurements

Solenoid Scan

• Rotationally symmetric beam \rightarrow solenoid is purely focussing in both planes with

$$k = \left(\frac{B}{2(p/e)}\right)^2$$
, where $B = \frac{\int B \, \mathrm{d}s}{l_{\text{eff}}}$

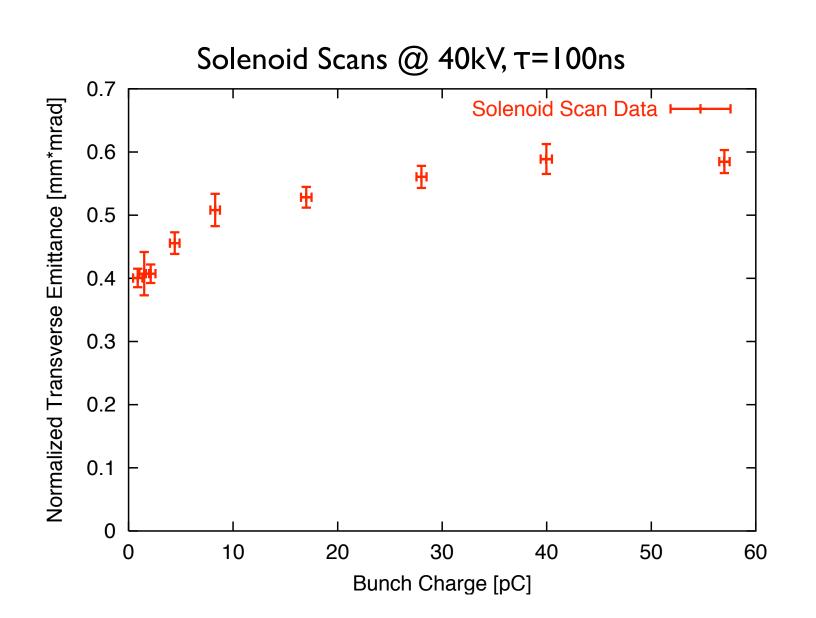

• In thin lens approximation

$$\sigma_{x,y}^2 = c_2 k^2 + c_1 k + c_0$$

- Measure downstream beam size as a function of solenoid current
- From quadratic fit derive emittance and twiss parameters at solenoid location

$$\sigma^2 = \varepsilon \beta = \mathcal{M}_{1,1}^2 \varepsilon \beta_0 - 2\mathcal{M}_{1,1} \mathcal{M}_{1,2} \varepsilon \alpha_0 + \mathcal{M}_{1,2}^2 \varepsilon \gamma_0$$

Solenoid Scan @ 40kV, Q=40pC 14 12 10 $\varepsilon_n = (5.883 \pm 0.237) \cdot 10^{-7} \text{ m rad}$ $\beta = (0.233 \pm 0.016) \text{ m}$ $\alpha = (-5.783 \pm 0.364)$ 400 600 800 1000 1200 1400 1600 1800 2000 2200 k [1/m²]

Slit / Pinhole Array Measurements

• Single slit (20µm): If beam size at slit is known, measuring the downstream beamlet width gives emittance in one shot (per plane)

$$\varepsilon_x = \sqrt{\langle x^2 \rangle \cdot \langle x'^2 \rangle}$$
, where $\langle x'^2 \rangle = \sigma_x^2 / L^2$

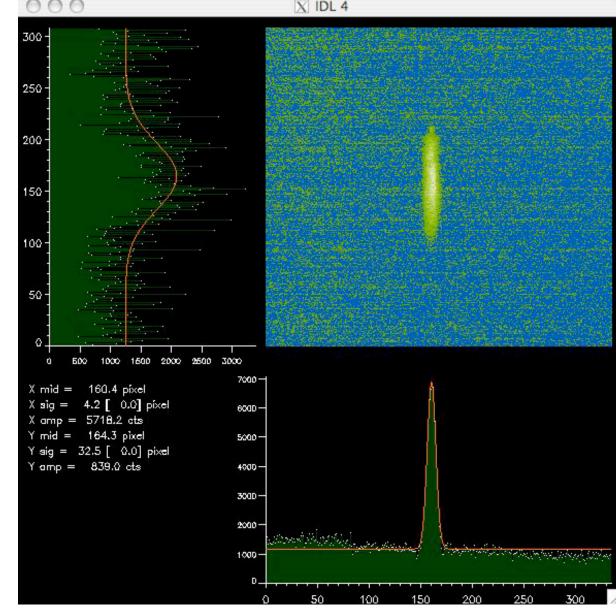

• Slit Array (20µm, I70µm pitch): Measure beamlet distributions and relative intensities; beamlet widths give momentum spread within each slit; correlated momentum spread of the entire bunch given by envelope over all beamlets \rightarrow emittance, twiss parameters and phase space density measured in one shot (per plane)

$$\overline{x}_{i}' = \langle x_{i} - \overline{x}_{i} \rangle / L$$

$$\sigma_{i}' = \sqrt{\langle (x_{i} - \overline{x}_{i})^{2} \rangle / L^{2} - (\overline{x}_{i}')^{2}}$$

• Pinhole Array (50µm, 320µm pitch): Similar to slit array, but delivers emittance, twiss parameters and phase space density in one shot for both planes!

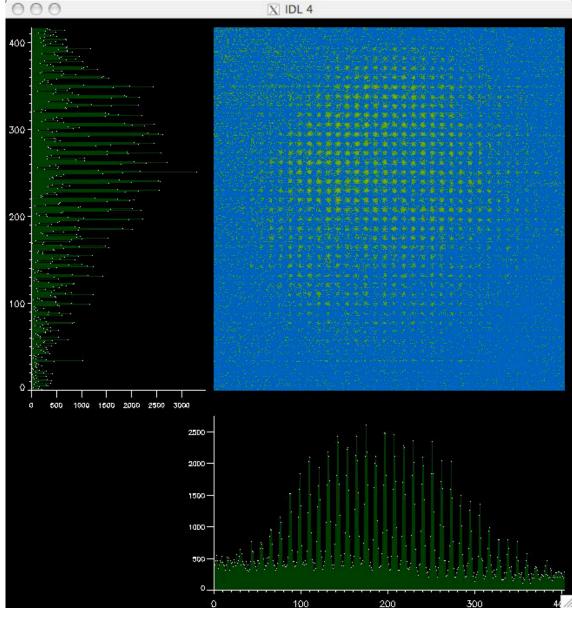

Single Slit Image @ 40kV, Q=40pC

 Δ L=39mm, I_{sol} =+0.81A \rightarrow B_z=47.3mT Beam size at slit: σ_x =715 μ m

 $\varepsilon_x = (2.54 \pm 0.29) \cdot 10^{-6} \text{ m rad}$

Pinhole Array Image @ 40kV, Q=56pC

 Δ L=39mm, I_{sol} =+0.44A \rightarrow B_z =25.7mT

 $\varepsilon_x = (1.47 \pm 0.29) \cdot 10^{-6} \text{ m rad}$ $\varepsilon_y = (2.14 \pm 0.43) \cdot 10^{-6} \text{ m rad}$
